# 2013 VERMONT WILDLIFE HARVEST REPORT – BLACK BEAR

VERMONT

FISH & WILDLIFE DEPARTMENT

(802) 828-1000 / [www.vtfishandwildlife.com](http://www.vtfishandwildlife.com)

Most of the programs described in this report are funded through the *Federal Aid in Wildlife Restoration Program*. This program was initiated in 1937 as the Federal Aid in Wildlife Act and created a system whereby taxes are paid on firearms, ammunition and archery equipment by the public who hunts. Today this excise tax generates over a hundred million dollars each year that are dedicated to state wildlife restoration and management projects across the United States. The State of Vermont uses these monies for acquiring land, and for restoring and managing wildlife. These excise tax dollars, coupled with state hunting license fees, have been the predominant source of money funding the successful restoration and management of Vermont's wildlife resources.

# 2013 Black Bear Report

## Vermont's Black Bear Population

The bear population in Vermont is currently estimated to be within the upper limit of the *Big Game Management Plan* population objective of 4,500 to 6,000 bears. To address issues identified in the plan, the Fish & Wildlife Department and the Fish & Wildlife Board adjusted the hunting season structure to increase the annual bear harvest beginning in 2013. The season was extended by four days at the end of the season to increase the harvest, and a separate bear license was created to obtain better management information on hunter numbers, effort and success rates.

The bear population is strong throughout the state, and abundant hunting opportunities exist in most areas. There are currently over 800,000 acres of public land open to hunting under state or federal management. To view or download maps of these public lands, go to the Department's web pages: [vtfishandwildlife.com](http://vtfishandwildlife.com).

To support Vermont's bear population, the Vermont Fish & Wildlife Department also protects wildlife habitat by reviewing and making habitat development recommendations on projects that require federal, state, or local permits for potential impacts to fish, wildlife and related habitats. During 2013, the Department reviewed and evaluated hundreds of proposed residential and commercial development projects. Of these, approximately two dozen projects involved significant bear habitat comprised of concentrated areas of hard mast trees, forested wetlands used by bears, and black bear travel corridors. Since 1995, there have been nearly 30,000 acres of significant bear habitat protected in Vermont through the environmental permitting process. Currently, Department biologists are reviewing plans for several large industrial wind projects that have been proposed for remote areas of the state that could potentially impact large areas of significant bear habitats. Due to the general lack of data on the potential impacts of wind generation projects on black bears, the Department has implemented a long-term study on this issue in southern Vermont that is associated with the Deerfield Wind Project.

Black Bear

## Public Education and Outreach

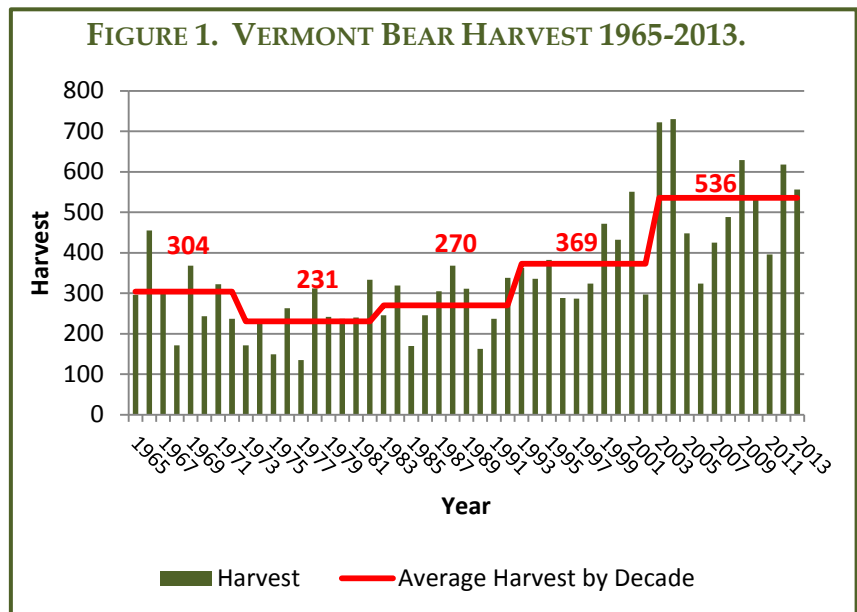

Biologists and game wardens gave eight bear presentations to communities and schools as requested. The bear project biologist also gave project updates at several Vermont Bear Hound Association meetings and gave "Living with Vermont Black Bear" presentations in several towns that were concerned about increased numbers of bear sightings in residential areas. Game wardens also responded to 265 complaints of black bears involved in automobile collisions, causing property damage or potentially threatening public safety in 2013.

## 2013 Harvest Summary

For the first time since a bear season was initiated in Vermont, Vermont's bear season was split into an early and late season. The early season started September 1 and ran through the start of the general firearms season commencing on November 15 while the late season ran the first nine days of the deer firearms season. Historically, the bear season ended on the first Wednesday of the deer firearms season. The four-day extension was implemented in 2013 to allow an additional weekend of bear hunting and to increase hunter harvest of bears in order to meet population objectives. A separate early season bear license is required; the cost is \$5.00 for residents and \$15.00 for non-residents. The late season license is granted with the purchase of a regular Vermont hunting license for no additional charge. Licensed hunters harvested 556 black bears (335 male, 206 females, 15 unknown) in Vermont during the combined 2013 seasons. This represents a decrease of 54 bears from the 2012 harvest of 610 bears, and an increase of 26 bears above the previous 10-year average yearly harvest of 537 bears (Figure 1). Approximately 21 tons (an estimated 41,625 lbs.) of boneless bear meat was harvested. Table 2 provides the 2013 Bear harvest by sex and town.

Annual surveys of both soft and hard mast were conducted by Department biologists in September and October. These are done to evaluate the relative abundance of the most important fall foods. Biologists have long recognized the influence that the availability and distribution of these important food items has on black bears in Vermont. Soft mast includes soft juicy berries, wild cherries, and apples while hard

most includes beechnuts, acorns, and hazelnuts. Vermont biologists go afield every year to assess mast availability as they recognize that food availability in general affects bear reproduction success, their seasonal movements, and timing of hibernation. Mast availability also influences the distribution of the bear harvest, road kills, and property damage. Survey results in 2013 indicated that apple production was much higher than normal, beechnut production was spotty in nature, but generally higher than in most years; some stands had very high numbers of large viable nuts, while others had very few nuts present. Acorn production was only fair, but acorns were more plentiful than in the two previous years. Both apples and acorns tend to occur at lower elevations while most beech stands heavily used by bears are at higher elevations most distant from roads. Bear harvests tend to be lower in years such as 2013 when beech mast is high, as bears travel less and forage at high elevations, making them less susceptible to hunters. However, the harvest during the overlap with deer season is generally higher in years with abundant beechnuts. Bears take advantage of the abundant nuts and delay hibernation making them vulnerable to the opportunistic deer hunter. The timing of the season's first

snowfalls, however, also affects the final harvest numbers. This year several early season snowfalls likely resulted in many bears, especially females, seeking their dens prior to the late bear season. Without this snow, the harvest during the overlap with the November deer season would have likely been considerably higher than it was.

During 2013, bear management activities continued to generate the information required to ensure that the population is managed at a sustainable level consistent with public desires. The current management program is based primarily on biological data collected from the mandatory bear harvest registration, through population and habitat indexes, as well as from occasional surveys of public desires derived through a detailed public input process undertaken every ten years.

Hunters who voluntarily submitted a tooth can learn the age of the bear they harvested. After the Department receives bear teeth, they are sent to a lab in Montana where the root is stained, sectioned, and the cementum lines counted to obtain the age of the bear at the time it was killed. The lab is able to obtain the age of most bears, but every year some teeth are damaged during removal and an age can't be determined. The names of some hunters can't be identified every year due to recording errors from tooth envelopes. Hunters will receive the ages of their bears by way of a postcard in April or May. Age results will also be posted on the Department's website at that time.

### **Total Bear Harvest for Hunting Seasons 1965-2013**

Total bear harvest is the combined harvest by still- and hound-hunters. The number of bears taken fluctuates fairly widely from year to year as illustrated in Figure 1. The current trend, however, is that the annual bear harvest has increased notably during the past four

decades. Periodic fluctuations in harvest generally occur due to differences in food availability (especially beechnuts) and weather conditions. The highest bear harvests in the past 50 years have been achieved in the past decade, with the 2013 harvest being slightly above the past ten-year average. These historic high harvests most likely reflect a strong bear population that is larger than previous decades. What is currently unknown is if it also indicates a possible increase in the number of hunters hunting specifically for bears. The Department will track early season license sales in the coming years to determine if bear hunter numbers are increasing or not.

### **Harvest Distribution**

Bears were harvested in all WMUs with the exception of WMU A and F1. The largest numbers of bears were taken in WMUs D2 (81), D1 (52), E (41), C (39), I (35), and N (34) (Table 1). It is interesting to note that a substantial number (149 or 27 percent) were taken from 9 WMUs (B, F1, F2, K2, M2, N, J1, J2, an O2) that, until recent decades, were considered to be on the fringe of typical bear range and visited infrequently by bears. Counties reporting the highest harvests were Montgomery and Sutton (each with 11), Craftsbury (10), and Dorset (9) (Figure 2 and Table 2).

### **Harvest by Hunting Opportunity**

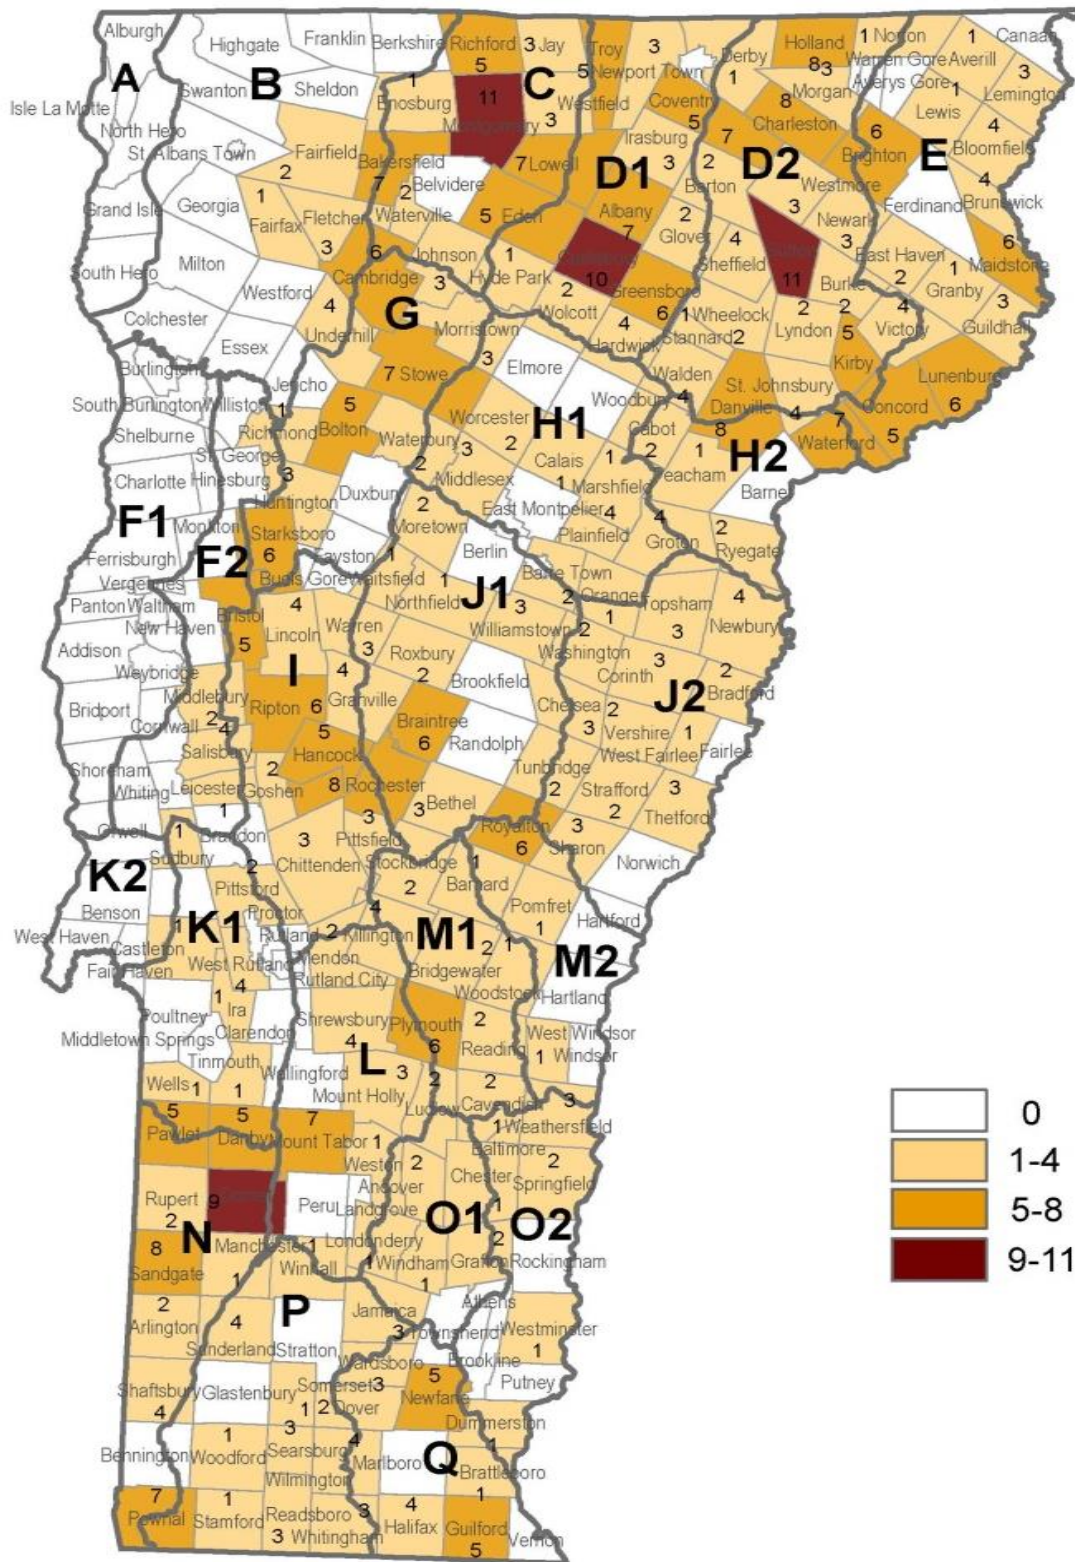

Bears in Vermont can be taken with the use of hounds, with firearms, and by archers. Snaring, trapping, and hunting with the use of bait is prohibited. All licensed hunters are potential bear hunters during the late bear hunting season as a bear tag for that time period is provided with every general hunting license sold. The actual number of deer hunters that would take a bear, if given the opportunity, is unknown. The total number of bear hunters in the state is similarly unknown.

<b>STATE TOTAL</b>		<b>556</b>	<b>202</b>	<b>329</b>	<b>25</b>

During the 2013 season 55 percent of the harvest was taken by hunters specifically targeting bears (Table 3) and 40 percent by opportunistic deer hunters (versus 11 percent by deer hunters in 2012). This increase in harvest of bear by deer hunters is characteristic of years such as 2013 when beechnuts are abundant. Twenty-three percent of the harvest of hunters specifically targeting bear was taken with the use of hounds, while houndsmen accounted for 13 percent of the total harvest. Archers took 10 percent of the total harvest. There were 93 bear hound permits issued (two more than in 2011), with one-tenth of them going to non-residents.

**TABLE 3. 2013 BEAR HARVEST BY HUNTING OPPORTUNITY**

Principal Species Hunter was Seeking	Number Harvested	Percent of Harvest
Bear	307	55%
• Harvest with dog	70	23%
• Harvest with no dog	237	77%
Deer	222	40%
Other/Unknown	27	5%

## Timing of Harvest

During the early season 305 bears were taken while 251 were harvested during the late season. Unlike the 2012 harvest where the vast majority of the harvest occurred during September and October (89 percent), almost half of the 2013 harvest (49 percent) occurred in November. Forty-five percent (251 bears) of the harvest occurred during the seven-day overlap with the November deer season (Table 4) compared to only 8 percent of the harvest during the 2012 deer season. The four-day extension to the end of the season that was implemented for the first time in 2013 resulted in 60 additional bears being harvested, or 11 percent of the total harvest.

## Heaviest Bears

A total of 16 bears weighing 300 or more pounds (scaled/dressed weight) were taken during the 2013 season (Table 5). The heaviest was 450 pounds and was taken in the town of Brownington. Similar to 2012, the greatest number of large bears was spread out throughout the state, although the actual heaviest four bears were all taken in the northeastern part of the state. Several additional large bears were reported that were not fully field dressed when brought into the check station for weighing and so are not reflected in this report. Six of the 20 heaviest bears were taken with the use of dogs. Many of the heavy

TABLE 4. TIMING OF HARVEST

Period When Harvested	Number Harvested	Percent of Harvest
September	139	25%
October	142	26%
November	275	49%
<i>(During Deer Season)</i>	251	45%
<i>(During last 4 Days of Deer Season)</i>	60	11%

bears in the harvest is due to bears taken in association with apple trees or corn fields. The average weight of all bears in the 2013 harvest was 151 pounds, up slightly from the average weight of 149 pounds in 2012. For more information on large bears harvested in Vermont, visit the website for Vermont Big Game Trophy Club at [vermontbiggametrophyclub.com](http://vermontbiggametrophyclub.com).

## Non-hunting Mortalities and Damage Complaints

In addition to the 556 bears taken legally during the regulated hunting season, 77 bear were reported as non-hunting (incidental) mortalities during 2013. Of these that were not taken by hunters, 50 were killed in motor vehicle collisions and 13 were dispatched as a result of bear-human conflicts (22 fewer than in 2012) (Table 6). Department law enforcement personnel received 188 property damage complaints involving bear, and wardens responded to 265 calls from the public regarding non-hunting mortality incidents and bear damage complaints.

**TABLE 6. 2013 NON-HUNTING MORTALITIES AND DAMAGE COMPLAINTS**

Mortality Type	Number
Vehicle Collision	50
Management/Damage	13
Illegal	2
Other or Unknown Cause	12
<b>Total</b>	<b>77</b>
Bear Damage Complaints	188

### Looking To the Future

The bear population in Vermont is healthy and is currently estimated to be near the upper limit of the *Big Game Management Plan* population objective of 4,500 to 6,000 bears. Changes to the season length and license requirements were made in 2013 to enable the

collection of improved management information on hunter numbers, hunter effort, and success rates. More than 10,500 hunters purchased the early season bear license in 2013 and from this pool of bear hunters, a random portion will be sent a bear hunting survey in 2014. Hunters will be requested to keep a record of when and where they hunt and of how many bears they observe during the bear hunting seasons.

The Department is also working to increase the percentage of bear teeth received from hunters. The teeth provide important information regarding the age structure of the population and the data is also used to help estimate the size of the bear population. Approximately 60 percent of the successful bear hunters submitted a tooth in 2013. The Department hopes to increase this rate for the upcoming bear seasons.

Hunters should also be aware that for 2014 some of the Wildlife Management Unit (WMU) boundaries have changed. This change is not only for black bear hunting, but for all game species. This may cause some confusion among hunters during this first year of the change. Recording the correct WMU is important for reporting a harvested animal as well as for use with any hunting surveys that a hunter might receive. A map of the new WMU designations and their boundaries is shown in the **2014 Vermont Guide to Hunting, Fishing & Trapping Laws**.
